Carnegie Mellon University

Intermediate SQL

LATE POLICY

You have a total of <u>4</u> late days for <u>projects only</u>.

- \rightarrow E.g., one project 4 days late, or four projects each 1 day late.
- → Late days rounded up to nearest integer. E.g., a submission that is 4 hours late will count as 1 day late.
- → If you hand in a homework late (or have used up your extension days for projects), you will lose <u>25% per day</u>.
 After 4 days, the grade will be 0%.

OFFICE HOURS

TA office hours have been added to the website.

We will have both in-person and remote (Zoom) options.

For in-person office hours, we are currently booking space.

Will be finalized by the end of this week.

RELATIONAL LANGUAGES

User only needs to specify the answer that they want, not how to compute it.

The DBMS is responsible for efficient evaluation of the query.

→ High-end systems have a sophisticated **query optimizer** that can rewrite queries and search for optimal execution strategies.

SQL HISTORY

IBM's first query language was called "SQUARE".

Originally developed in 1974 as "SEQUEL" for IBM System R prototype DBMS.

- \rightarrow Structured English Query Language
- \rightarrow Adopted by Oracle in the 1970s.

IBM releases commercial SQL-based DBMSs:

→ System/38 (1979), SQL/DS (1981), and DB2 (1983).

ANSI Standard in 1986. ISO in 1987

 \rightarrow Structured Query Language

SQL HISTORY

Current standard is **SQL:2016**

- \rightarrow **SQL:2016** \rightarrow JSON, Polymorphic tables
- \rightarrow **SQL:2011** \rightarrow Temporal DBs, Pipelined DML
- → **SQL:2008** → Truncation, Fancy Sorting
- → **SQL:2003** → XML, Windows, Sequences, Auto-Gen IDs.
- \rightarrow **SQL:1999** \rightarrow Regex, Triggers, OO

The minimum language syntax a system needs to say that it supports SQL is **SQL-92**.

RELATIONAL LANGUAGES

Data Manipulation Language (DML)
Data Definition Language (DDL)
Data Control Language (DCL)

Also includes:

- → View definition
- → Integrity & Referential Constraints
- → Transactions

Important: SQL is based on **bags** (duplicates) not **sets** (no duplicates).

TODAY'S AGENDA

Aggregations + Group By

String / Date / Time Operations

Output Control + Redirection

Nested Queries

Common Table Expressions

Window Functions

EXAMPLE DATABASE

student(sid, name, login, gpa)

sid	name	login	age	gpa
53666	Kanye	kanye@cs	44	4.0
53688	Bieber	jbieber@cs	27	3.9
53655	Tupac	shakur@cs	25	3.5

course(cid, name)

cid	name	
15-445	Database Systems	
15-721	Advanced Database Systems	
15-826	Data Mining	
15-823	Advanced Topics in Databases	

enrolled(sid,cid,grade)

sid	cid	grade
53666	15-445	С
53688	15-721	A
53688	15-826	В
53655	15-445	В
53666	15-721	С

As we saw last class, the basic syntax for a query is:

```
SELECT column1, column2, ...
FROM table
WHERE predicate1, predicate2, ...
```

Get the names and GPAs of all students who are older than 25 years old.

SELECT name, gpa
FROM student
WHERE age > 25

Get the names and GPAs of all students who are older than 25 years old.

SELECT name, gpa
FROM student
WHERE age > 25

 $\Pi_{\text{name,gpa}}$ (Projection)

Get the names and GPAs of all students who are older than 25 years old.

SELECT name, gpa
FROM student
WHERE age > 25

 $\Pi_{\text{name,gpa}}$ (Projection)

 $\sigma_{age>25}$ (Selection)

BASIC SYNTAX: JOINS

Recall the relational algebra join operator (⋈) from last class.

Which students got an A in 15-721?

```
SELECT s.name
  FROM enrolled AS e, student AS s
WHERE e.grade = 'A' AND e.cid = '15-721'
  AND e.sid = s.sid
```

Functions that return a single value from a bag of tuples:

- \rightarrow AVG(col) \rightarrow Return the average col value.
- → MIN(col) → Return minimum col value.
- → MAX(col) → Return maximum col value.
- \rightarrow **SUM(col)** \rightarrow Return sum of values in col.
- \rightarrow **COUNT(col)** \rightarrow Return # of values for col.

Aggregate functions can (almost) only be used in the **SELECT** output list.

```
SELECT COUNT(login) AS cnt
FROM student WHERE login LIKE '%@cs'
```

Aggregate functions can (almost) only be used in the **SELECT** output list.

```
SELECT COUNT(login) AS cnt
FROM student WHERE login LIKE '%@cs'
```

Aggregate functions can (almost) only be used in the **SELECT** output list.

```
SELECT COUNT(login) AS cnt
FROM student WHFRF login LTKF '%@cs'

SELECT COUNT(*) AS cnt
FROM student WHERE login LIKE '%@cs'
```

Aggregate functions can (almost) only be used in the **SELECT** output list.

```
SELECT COUNT(login) AS cnt
FROM student WHERE login LIKE '%@cs'
SELECT COUNT(*) AS cnt
FROM student WHERE login LIKE '%@cs'
SELECT COUNT(1) AS cnt
FROM student WHERE login LIKE '%@cs'
```

MULTIPLE AGGREGATES

Get the number of students and their average GPA that have a "@cs" login.

SELECT AVG(gpa), COUNT(sid)
FROM student WHERE login LIKE '%@cs'

MULTIPLE AGGREGATES

Get the number of students and their average GPA that have a "@cs" login.

	AVG(gpa)	COUNT(sid)
SELECT AVG(gpa), COUNT(sid)	3.8	3
FROM student WHERE login LIKE	'%@cs'	

DISTINCT AGGREGATES

COUNT, SUM, AVG support DISTINCT

Get the number of unique students that have an "@cs" login.

SELECT COUNT(DISTINCT login)
FROM student WHERE login LIKE '%@cs'

DISTINCT AGGREGATES

COUNT, SUM, AVG support DISTINCT

Get the number of unique students that have an "@cs" login.

SELECT COUNT(DISTINCT login)

FROM student WHERE login LIKE '%@cs'

Output of other columns outside of an aggregate is undefined.

Get the average GPA of students enrolled in each course.

```
SELECT AVG(s.gpa), e.cid
FROM enrolled AS e, student AS s
WHERE e.sid = s.sid
```

Output of other columns outside of an aggregate is undefined.

Get the average GPA of students enrolled in each course.

```
SELECT AVG(s.gpa), e.cid

FROM enrolled AS e, student AS s

WHERE e.sid = s.sid
```

Project tuples into subsets and calculate aggregates against each subset.

Project tuples into subsets and calculate aggregates against each subset.

e.sid	s.sid	s.gpa	e.cid
53435	53435	2.25	15-721
53439	53439	2.70	15-721
56023	56023	2.75	15-826
59439	59439	3.90	15-826
53961	53961	3.50	15-826
58345	58345	1.89	15-445

Project tuples into subsets and calculate aggregates against each subset.

e.sid	s.sid	s.gpa	e.cid
53435	53435	2.25	15-721
53439	53439	2.70	15-721
56023	56023	2.75	15-826
59439	59439	3.90	15-826
53961	53961	3.50	15-826
58345	58345	1.89	15-445

Project tuples into subsets and calculate aggregates against each subset.

e.sid	s.sid	s.gpa	e.cid
53435	53435	2.25	15-721
53439	53439	2.70	15-721
56023	56023	2.75	15-826
59439	59439	3.90	15-826
53961	53961	3.50	15-826
58345	58345	1.89	15-445

AVG(s.gpa)	e.cid
2.46	15-721
3.39	15-826
1.89	15-445

Project tuples into subsets and calculate aggregates against each subset.

e.sid	s.sid	s.gpa	e.cid
53435	53435	2.25	15-721
53439	53439	2.70	15-721
56023	56023	2.75	15-826
59439	59439	3.90	15-826
53961	53961	3.50	15-826
58345	58345	1.89	15-445

AVG(s.gpa)	e.cid
2.46	15-721
3.39	15-826
1.89	15-445

```
SELECT AVG(s.gpa), e.cid, s.name
  FROM enrolled AS e, student AS s
WHERE e.sid = s.sid
GROUP BY e.cid
```

```
SELECT AVG(s.gpa), e.cid, s.name
FROM enrolled AS e, student AS s
WHERE e.sid = s.sid
GROUP BY e.cid
```

```
SELECT AVG(s.gpa), e.cid, s.name
FROM enrolled AS e, student AS s
WHERE e.sid = s.sid
GROUP BY e.cid
```

```
SELECT AVG(s.gpa), e.cid, s.name
  FROM enrolled AS e, student AS s
WHERE e.sid = s.sid
GROUP BY e.cid, s.name
```

HAVING

Filters results based on aggregation computation.

Like a WHERE clause for a GROUP BY

```
SELECT AVG(s.gpa) AS avg_gpa, e.cid
  FROM enrolled AS e, student AS s
WHERE e.sid = s.sid
  AND avg_gpa > 3.9
GROUP BY e.cid
```

HAVING

Filters results based on aggregation computation.

Like a WHERE clause for a GROUP BY

```
SELECT AVG(s.gpa) AS avg_gpa, e.cid
  FROM enrolled AS e, student AS s
WHERE e.sid = s.sid
  AND avg_gpa > 3.9
GROUP BY e.cid
```

Filters results based on aggregation computation.

```
SELECT AVG(s.gpa) AS avg_gpa, e.cid
FROM enrolled AS e, student AS s
WHERE e.sid = s.sid
AND avg_gpa > 3.9
GROUP BY e.cid
```

Filters results based on aggregation computation.

```
SELECT AVG(s.gpa) AS avg_gpa, e.cid
  FROM enrolled AS e, student AS s
WHERE e.sid = s.sid
GROUP BY e.cid
HAVING avg_gpa > 3.9;
```

Filters results based on aggregation computation.

```
SELECT AVG(s.gpa) AS avg_gpa, e.cid
  FROM enrolled AS e, student AS s
WHERE e.sid = s.sid
GROUP BY e.cid
HAVING avg_gpa > 3.9;
```

Filters results based on aggregation computation.

```
SELECT AVG(s.gpa) AS avg_gpa, e.cid
  FROM enrolled AS e, student AS s
WHERE e.sid = s.sid
GROUP BY e.cid
HAVING AVG(s.gpa) > 3.9;
```

Filters results based on aggregation computation.

```
SELECT AVG(s.gpa) AS avg_gpa, e.cid
  FROM enrolled AS e, student AS s
WHERE e.sid = s.sid
GROUP BY e.cid
HAVING AVG(s.gpa) > 3.9;
```

AVG(s.gpa)	e.cid
3.75	15-415
3.950000	15-721
3.900000	15-826

avg_gpa	e.cid
3.950000	15-721

	String Case	String Quotes		
SQL-92	Sensitive	Single Only		
Postgres	Sensitive	Single Only		
MySQL	Insensitive	Single/Double		
SQLite	Sensitive	Single/Double		
DB2	Sensitive	Single Only		
Oracle	Sensitive	Single Only		
<pre>WHERE UPPER(name) = UPPER('KaNyE')</pre>				
WHERE name	e = "KaNyE"	MySQL		

LIKE is used for string matching.

String-matching operators

- → '%' Matches any substring (including empty strings).
- → '_ ' Match any one character

```
SELECT * FROM enrolled AS e WHERE e.cid LIKE '15-%'
```

```
SELECT * FROM student AS s
WHERE s.login LIKE '%@c_'
```

SQL-92 defines string functions.

→ Many DBMSs also have their own unique functions

Can be used in either output and predicates:

```
SELECT SUBSTRING(name,1,5) AS abbrv_name
FROM student WHERE sid = 53688
```

```
SELECT * FROM student AS s
WHERE UPPER(s.name) LIKE 'KAN%'
```

SQL standard says to use | operator to concatenate two or more strings together.

```
SELECT name FROM student
WHERE login = LOWER(name) | '@cs'

SELECT name FROM student
WHERE login = LOWER(name) + '@cs'

SELECT name FROM student
WHERE login = CONCAT(LOWER(name), '@cs')
```

DATE/TIME OPERATIONS

Operations to manipulate and modify **DATE/TIME** attributes.

Can be used in both output and predicates.

Support/syntax varies wildly...

Demo: Get the # of days since the beginning of the year.

OUTPUT REDIRECTION

Store query results in another table:

- \rightarrow Table must not already be defined.
- → Table will have the same # of columns with the same types as the input.

```
SELECT DISTINCT cid INTO CourseIds
FROM enrolled;
```

```
CREATE TABLE CourseIds (
SELECT DISTINCT cid FROM enrolled);

MySQL
```

OUTPUT REDIRECTION

Insert tuples from query into another table:

- → Inner **SELECT** must generate the same columns as the target table.
- → DBMSs have different options/syntax on what to do with integrity violations (e.g., invalid duplicates).

INSERT INTO CourseIds
(SELECT DISTINCT cid FROM enrolled);

ORDER BY <column*> [ASC|DESC]

```
SELECT sid, grade FROM enrolled
WHERE cid = '15-721'
ORDER BY grade
```

ORDER BY <column*> [ASC|DESC]

CELECT aid grade EDOM envelled	sid	grade
	53123	Α
WHERE cid = '15-721'	53334	Α
ORDER BY grade	53650	В
6.6.6.6	53666	D

ORDER BY <column*> [ASC|DESC]

```
SELECT sid, grade FROM enrolled

WH SELECT sid, grade FROM enrolled

OF WHERE cid = '15-721'

ORDER BY 1
```

ORDER BY <column*> [ASC|DESC]

```
SELECT sid, grade FROM enrolled

WH SELECT sid, grade FROM enrolled

OF WHERE cid = '15-721'

ORDER BY 1

ORDER BY 1
```

```
SELECT sid FROM enrolled

WH SELECT sid FROM enrolled

OF WHERE cid = '15-721'

ORDER BY grade DESC, 1 ASC
```

LIMIT <count> [offset]

- \rightarrow Limit the # of tuples returned in output.
- → Can set an offset to return a "range"

```
SELECT sid, name FROM student
WHERE login LIKE '%@cs'
LIMIT 10
```

LIMIT <count> [offset]

- \rightarrow Limit the # of tuples returned in output.
- → Can set an offset to return a "range"

```
SELECT sid, name FROM student
WHERE login LIKE '%@cs'
LIMIT 10
```

```
SELECT sid, name FROM student
WHERE login LIKE '%@cs'
LIMIT 20 OFFSET 10
```

Queries containing other queries.

They are often difficult to optimize.

Inner queries can appear (almost) anywhere in query.

Queries containing other queries.

They are often difficult to optimize.

Inner queries can appear (almost) anywhere in query.

SELECT name FROM student WHERE
sid IN (SELECT sid FROM enrolled)

Queries containing other queries.

They are often difficult to optimize.

Inner queries can appear (almost) anywhere in query.

Outer Query
SELECT name FROM student WHERE

sid IN (SELECT sid FROM enrolled)
Inner Query

Queries containing other queries.

They are often difficult to optimize.

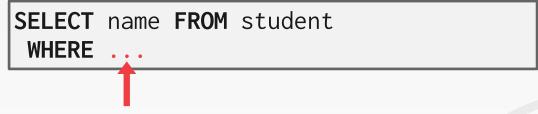

Inner queries can appear (almost) anywhere in query.

Outer Query
SELECT name FROM student WHERE

sid IN (SELECT sid FROM enrolled)
Inner Query

Get the names of students in '15-445'

sid in the set of people that take 15-445

```
SELECT name FROM student
WHERE ...
SELECT sid FROM enrolled
WHERE cid = '15-445'
```

```
SELECT name FROM student
WHERE sid IN (
   SELECT sid FROM enrolled
   WHERE cid = '15-445'
)
```

```
SELECT name FROM student
WHERE sid IN (
SELECT sid FROM enrolled
WHERE cid = '15-445'
)
```

ALL→ Must satisfy expression for all rows in the sub-query.

ANY→ Must satisfy expression for at least one row in the sub-query.

IN→ Equivalent to '=ANY()'.

EXISTS→ At least one row is returned.

```
SELECT name FROM student
WHERE sid = ANY(
    SELECT sid FROM enrolled
    WHERE cid = '15-445'
)
```

Find student record with the highest id that is enrolled in at least one course.

Find student record with the highest id that is enrolled in at least one course.

```
SELECT MAX(e.sid), s.name
  FROM enrolled AS e, student AS s
WHERE e.sid = s.sid;
```

Find student record with the highest id that is enrolled in at least one course.

```
SELECT MAX(e.sid), s.name
  FROM enrolled AS e, student AS s
WHERE e.sid = s.sid;
```

This won't work in SQL-92. It runs in SQLite, but not Postgres or MySQL (v8 with strict mode).

Find student record with the highest id that is enrolled in at least one course.

```
SELECT sid, name FROM student WHERE ...
```

Find student record with the highest id that is enrolled in at least one course.

```
SELECT sid, name FROM student WHERE ...
```

"Is the highest enrolled sid"

Find student record with the highest id that is enrolled in at least one course.

SELECT sid, name FROM student
WHERE sid is the
SELECT MAX(sid) FROM enrolled

```
SELECT sid, name FROM student
WHERE sid IN (
SELECT MAX(sid) FROM enrolled
)
```

```
SELECT sid name FROM student

SELECT sid, name FROM student

WHERE sid IN (

SELECT sid FROM enrolled

ORDER BY sid DESC LIMIT 1

)
```

```
SELECT sid name FROM student

WHERE sid TN (

SI SELECT student.sid, name

FROM student

JOIN (SELECT MAX(sid) AS sid

FROM enrolled) AS max_e

ON student.sid = max_e.sid;
```

Find all courses that have no students enrolled in it.

```
SELECT * FROM course WHERE ...
```

"with no tuples in the enrolled table"

cid	name
15-445	Database Systems
15-721	Advanced Database Systems
15-826	Data Mining
15-823	Advanced Topics in Databases

sid	cid	grade
53666	15-445	С
53688	15-721	Α
53688	15-826	В
53655	15-445	В
53666	15-721	С

Find all courses that have no students enrolled in it.

```
SELECT * FROM course
WHERE NOT EXISTS(
tuples in the enrolled table
)
```

Find all courses that have no students enrolled in it.

```
SELECT * FROM course
WHERE NOT EXISTS(
    SELECT * FROM enrolled
    WHERE course.cid = enrolled.cid
)
```

cid	name
15-823	Advanced Topics in Databases

Find all courses that have no students enrolled in it.

```
SELECT * FROM course
WHERE NOT EXISTS(
    SELECT * FROM enrolled
    WHERE course.cid = enrolled.cid
)
```

cid	name
15-823	Advanced Topics in Databases

Performs a "sliding" calculation across a set of tuples that are related.

Like an aggregation but tuples are not grouped into a single output tuples.

```
SELECT ... FUNC-NAME(...) OVER (...)
FROM tableName
```

Performs a "sliding" calculation across a set of tuples that are related.

Like an aggregation but tuples are not grouped into a single output tuples.

```
SELECT ... FUNC-NAME(...) OVER (...)
FROM tableName
```

Aggregation Functions
Special Functions

Performs a "sliding" calculation across a set of tuples that are related.

Like an aggregation but tuples are not grouped into a single output tuples.

How to "slice" up data
Can also sort

```
SELECT ... FUNC-NAME(...) OVER (...)
FROM tableName
```

Aggregation Functions Special Functions

Aggregation functions:

→ Anything that we discussed earlier

Special window functions:

- \rightarrow **ROW_NUMBER()** \rightarrow # of the current row
- → RANK()→ Order position of the current row.

```
SELECT *, ROW_NUMBER() OVER () AS row_num
FROM enrolled
```

Aggregation functions:

→ Anything that we discussed earlier

Special window functions:

- \rightarrow **ROW_NUMBER()** \rightarrow # of the current row
- → RANK()→ Order position of the current row.

sid	cid	grade	row_num
53666	15-445	С	1
53688	15-721	Α	2
53688	15-826	В	3
53655	15-445	В	4
53666	15-721	С	5

```
SELECT *, ROW_NUMBER() OVER () AS row_num
FROM enrolled
```

Aggregation functions:

→ Anything that we discussed earlier

Special window functions:

- \rightarrow **ROW_NUMBER()** \rightarrow # of the current row
- → RANK()→ Order position of the current row.

sid	cid	grade	row_num
53666	15-445	С	1
53688	15-721	Α	2
53688	15-826	В	3
53655	15-445	В	4
53666	15-721	С	5

SELECT *, ROW_NUMBER() OVER () AS row_num
FROM enrolled

The **OVER** keyword specifies how to group together tuples when computing the window function.

Use **PARTITION BY** to specify group.

```
SELECT cid, sid,
ROW_NUMBER() OVER (PARTITION BY cid)
FROM enrolled
ORDER BY cid
```

The **OVER** keyword specifies how to group together tuples when computing the window function.

Use **PARTITION BY** to specify group.

cid	sid	row_number
15-445	53666	1
15-445	53655	2
15-721	53688	1
15-721	53666	2
15-826	53688	1

```
SELECT cid, sid,

ROW_NUMBER() OVER (PARTITION BY cid)

FROM enrolled
ORDER BY cid
```

The **OVER** keyword specifies how to group together tuples when computing the window function.

Use **PARTITION BY** to specify group.

cid	sid	row_number
15-445	53666	1
15-445	53655	2
15-721	53688	1
15-721	53666	2
15-826	53688	1

```
SELECT cid, sid,
ROW_NUMBER() OVER (PARTITION BY cid)
FROM enrolled
ORDER BY cid
```

You can also include an **ORDER BY** in the window grouping to sort entries in each group.

```
SELECT *,

ROW_NUMBER() OVER (ORDER BY cid)

FROM enrolled
ORDER BY cid
```

Find the student with the <u>second</u> highest grade for each course.

```
SELECT * FROM (
    SELECT *, RANK() OVER (PARTITION BY cid
          ORDER BY grade ASC) AS rank
    FROM enrolled) AS ranking
WHERE ranking.rank = 2
```

Find the student with the <u>second</u> highest grade for each course.

Group tuples by cid Then sort by grade

```
SELECT * FROM (
    SELECT *, RANK() OVER (PARTITION BY cid
          ORDER BY grade ASC) AS rank
    FROM enrolled) AS ranking
WHERE ranking.rank = 2
```

Find the student with the <u>second</u> highest grade for each course.

Group tuples by cid Then sort by grade

```
SELECT * FROM (
SELECT *, RANK() OVER (PARTITION BY cid
ORDER BY grade ASC) AS rank
FROM enrolled) AS ranking
WHERE ranking.rank - 2
```

Provides a way to write auxiliary statements for use in a larger query.

 \rightarrow Think of it like a temp table just for one query.

Alternative to nested queries and views.

```
WITH cteName AS (
SELECT 1
)
SELECT * FROM cteName
```

Provides a way to write auxiliary statements for use in a larger query.

 \rightarrow Think of it like a temp table just for one query.

Alternative to nested queries and views.

```
WITH cteName AS (
SELECT 1
)
SELECT * FROM cteName
```

```
WITH cteName (col1, col2) AS (
SELECT 1, 2
)
SELECT col1 + col2 FROM cteName
```

```
WITH cteName (col1, col2) AS (
SELECT 1, 2
)
SELECT col1 + col2 FROM cteName
```

```
WITH cteName (colXXX, colXXX) AS (
   SELECT 1, 2
)
SELECT colXXX + colXXX FROM cteName
```

```
WITH cteName (col1, col2) AS (
SELECT 1, 2
)
SELECT col1 + col2 FROM cteName
```

```
WITH cteName (colXXX, colXXX) AS (
   SELECT 1, 2
)
SELECT colXXX + colXXX FROM cteName
```

You can bind output columns to names before the AS keyword.

```
WITH cteName (col1, col2) AS (
    SELECT 1, 2
)
SELECT col1 + col2 FROM cteName

WITH cteName (colxxx, colxxx) AS (
    SELECT 1, 2
```

SELECT colXXX + colXXX FROM cteName

```
WITH cteName (col1, col2) AS (
SELECT 1, 2
)
SELECT col1 + col2 FROM cteName
```

```
WITH cteName (colXXX, colXXX) AS (
    SELECT 1, 2
)
SELECT * FROM cteName
```

```
WITH cteSource (maxId) AS (
    SELECT MAX(sid) FROM enrolled
)
SELECT name FROM student, cteSource
WHERE student.sid = cteSource.maxId
```

```
WITH cteSource (maxId) AS (
    SELECT MAX(sid) FROM enrolled
)
SELECT name FROM student, cteSource
WHERE student.sid = cteSource.maxId
```

CTE - RECURSION

Print the sequence of numbers from 1 to 10.

```
WITH RECURSIVE cteSource (counter) AS (
    (SELECT 1)
    UNION ALL
    (SELECT counter + 1 FROM cteSource
     WHERE counter < 10)
)
SELECT * FROM cteSource</pre>
```

Demo: CTEs!

CTE - RECURSION

Print the sequence of numbers from 1 to 10.

```
WITH RECURSIVE cteSource (counter) AS (
    (SELECT 1)
    UNION ALL
    (SELECT counter + 1 FROM cteSource
     WHERE counter < 10)
)
SELECT * FROM cteSource</pre>
```

Demo: CTEs!

CONCLUSION

SQL is not a dead language.

You should (almost) always strive to compute your answer as a single SQL statement.

HOMEWORK #1

Write SQL queries to perform basic data analysis.

- \rightarrow Write the queries locally using SQLite.
- → Submit them to Gradescope
- → You can submit multiple times and use your best score.

Due: Sunday Sept 12th @ 11:59pm
